</table>
| Electronic health record (EHR) system to serve as a centralized location for all patient information | • Accurate and complete patient information at the point of care  
• Facilitates efficient, coordinated care                                                                                                                        |
| Continuous monitoring to capture information during treatment and recovery               | • Continuous collection and communication of patient status  
• Communication platforms can alert caregivers of predefined medical events  
• Sensing technology can detect incontinence and provide trending information that can be used to help detect patient deterioration before complications occur |
| Data management and analysis systems                                                    | • Data algorithms can help avoid data overload by identifying critical patterns  
• Data analysis can translate information to actionable insights                                                                                                  |
| Communication solutions                                                                | • Alert systems to more quickly address patient needs in real time  
• Communication between care teams inside and outside the hospital                                                                                               |
